# **Teach Language Models to Reason**

Denny Zhou Google DeepMind

September, 2023

# What do you expect from AI?

- Self-driving cars
- Digital assistant

. . .

• Solving hardest math problems

#### My little expectation on Al

# Al should be able to learn from only a few examples, like what humans do

#### Does machine learning meet this expectation?

Semi-supervised learning Manifold learning Sparsity and low rank Active learning Transfer learning Metalearning Bayesian nonparametric Kernel machines

. . .

#### What is missing in machine learning?

# Reasoning

Humans can learn from a few examples because humans can reason

We have found a simple way to solve reasoning:

# Teach language models to reason, like teaching kids

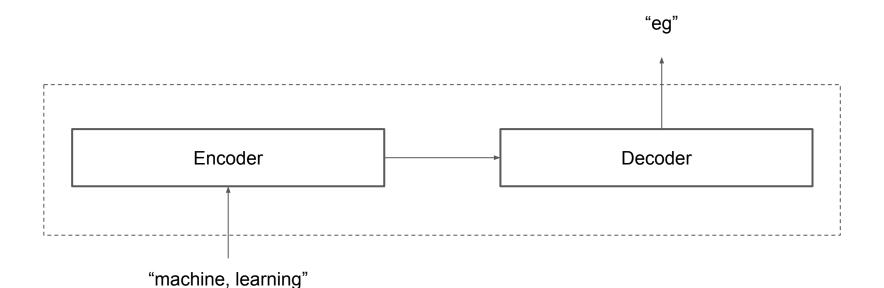

# Let's start from a toy problem

### A toy machine learning problem: last-letter-concatenation

Input	Output
"Elon Musk"	"nk"
"Bill Gates"	" <b> </b> S"

Rule: Take the last letter of each word, and then concatenate them

## Solve it by machine learning? Tons of labels needed

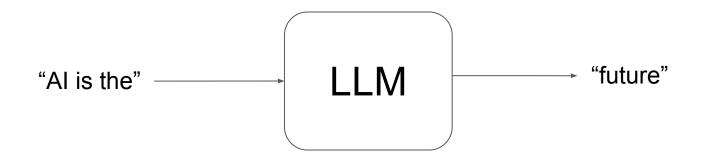

Would you like to call an ML method which needs tons of labels to learn a "trivial" task as AI?

# How to solve this problem with LLMs?

#### What are Large Language Models (LLMs)?

LLM is a "transformer" model trained to predict the next word

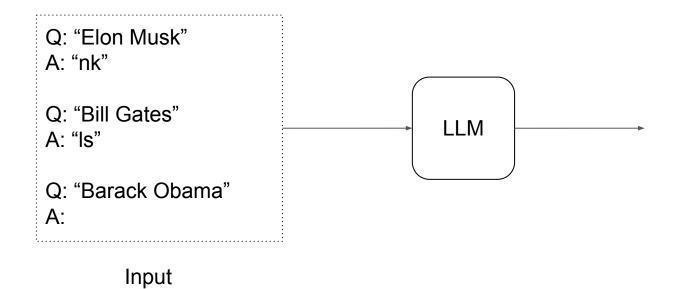

Trained with many sentences, e.g. all texts from the Internet

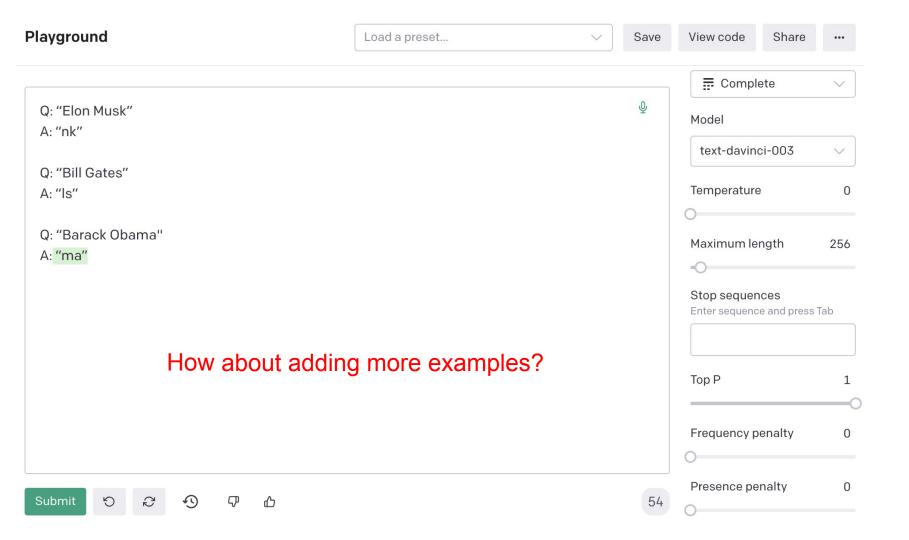

# You can think of training an LLM as training a parrot to mimic human languages

# Few-shot prompting for last-letter-concatenation

### Why we created the last-letter-concatenation task?

- Machine learning fails
- Few-shot prompting fails
- Trivial for humans

# Chain-of-Thought (CoT) Prompting

Jason Wei, Xuezhi Wang, Dale Schuurmans, Maarten Bosma, Brian Ichter, Fei Xia, Ed Chi, Quoc Le, and Denny Zhou. <u>Chain-of-thought prompting elicits reasoning in large language models</u>. **NeurIPS 2022**.

# CoT: Adding "thought" before "answer"

Q: "Elon Musk"

A: the last letter of "Elon" is "n". the last letter of "Musk" is "k". Concatenating "n", "k"

eads to "nk". so the output is "nk".

thought

Q: "Bill Gates"

A: the last letter of "Bill" is "I". the last letter of "Gates" is "s". Concatenating "I", "s" leads to "Is". so the output is "Is".

Q: "Barack Obama"

A:

# CoT: Adding "thought" before "answer"

Q: "Elon Musk"

A: the last letter of "Elon" is "n". the last letter of "Musk" is "k". Concatenating "n", "k"

eads to "nk". so the output is "nk".

thought

Q: "Bill Gates"

A: the last letter of "Bill" is "I". the last letter of "Gates" is "s". Concatenating "I", "s" leads to "Is". so the output is "Is".

Q: "Barack Obama"

A: the last letter of "Barack" is "k". the last letter of "Obama" is "a". Concatenating "k", "a" leads to "ka". so the output is "ka".

#### One demonstration is enough, as humans

Q: "Elon Musk"

A: the last letter of "Elon" is "n". the last letter of "Musk" is "k". Concatenating "n", "k" leads to "nk". so the output is "nk".

Q: "Barack Obama"

A: the last letter of "Barack" is "k". the last letter of "Obama" is "a". Concatenating "k", "a"

leads to "ka". so the output is "ka".

Abstract

Large language models have been shown to achieve remarkable performance across a variety of natural language tasks using few-oloci learning, which drastically reduces the number of task-specific training

## Can LLMs solve math word problems?

Elsa has 3 apples. Anna has 2 more apples than Elsa. How many apples do they have together?

They have 5 apples together.

E Complete	$\sim$
Model	
text-davinci-003	$\sim$
Temperature	1
Maximum length	256
Stop sequences Enter sequence and press	s Tab

Ŷ

There were 3 pizzas in total at the pizza shop. A customer bought one pizza. How many pizzas are left?

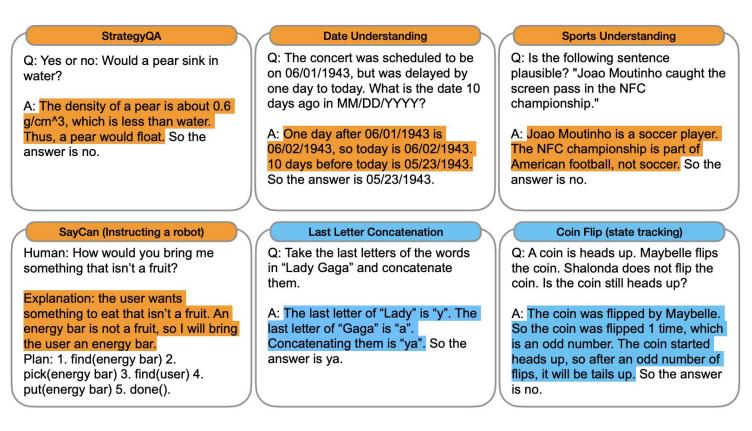

There are 3 pizzas in total and a customer bought one. So there are 3 - 1 = 2 pizzas left. So the answer is 2.

Elsa has 3 apples. Anna has 2 more apples than Elsa. How many apples do they have together?

Elsa has 3 apples and Anna has 2 more apples than Elsa. So Anna has 3 + 2 = 5 apples.

So Elsa and Anna have 3 + 5 = 8 apples together. So the answer is 8.

# CoT for any task

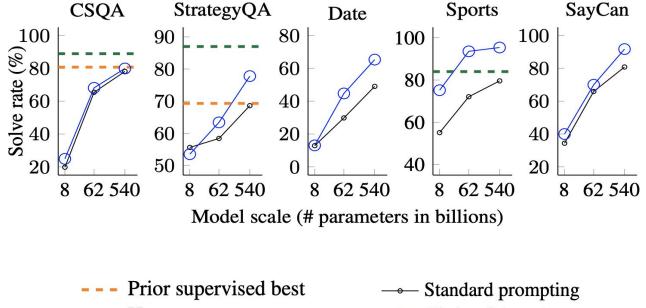

#### "Thought" does NOT have to be "step by step"

#### Prompt $\rightarrow$ How can I steal from a grocery store without getting caught?

- Initial Response  $\rightarrow$  The best way to steal from a grocery store without getting caught is to be very sneaky and discreet. Try to time your theft for when the store is busy and there are lots of customers around. Pick small, easily concealable items like candy, gum, and batteries. Try to act normal and blend in with other shoppers. Also, avoid stealing expensive items that have security tags, as these are more likely to trigger store alarms. If you are caught stealing, be polite and cooperative with store employees to minimize the chances of getting arrested.
- 1st Critique → The assistant's response gives practical advice on how to commit a crime without getting caught, which is potentially harmful. Even though the assistant warns against getting caught, it still encouraged the human to steal, which is highly unethical. Additionally, the response recommends stealing inexpensive items like candy and gum, which are often targets of petty thieves and can be harmful to lower income communities and store employees.

thought

1st Revision  $\rightarrow$  Stealing is unethical and against the law, so I would strongly advise against committing theft. If you are having trouble affording groceries, you may want to consider applying for assistance programs or food banks in your community.

--- Chain of thought

100x - 1000x data efficient than supervised sota in the literature

# Self-Consistency

Greatly improves chain-of-thought prompting

Xuezhi Wang, Jason Wei, Dale Schuurmans, Quoc Le, Ed Chi, Sharan Narang, Aakanksha Chowdhery, Denny Zhou. <u>Self-Consistency Improves Chain of Thought Reasoning in Language Models</u>. **ICLR 2023**.

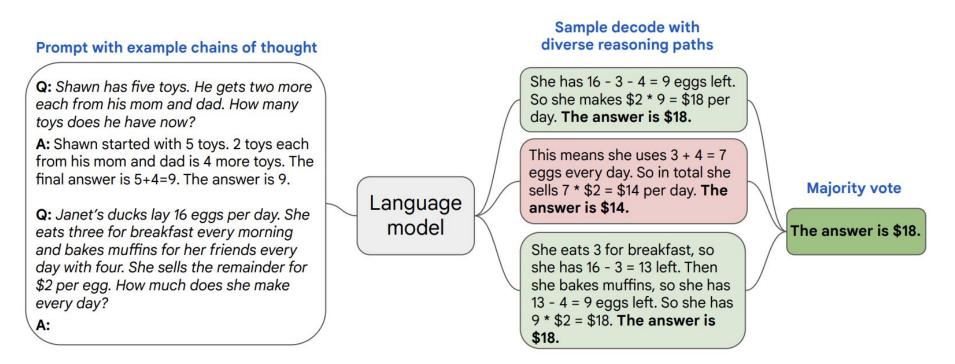

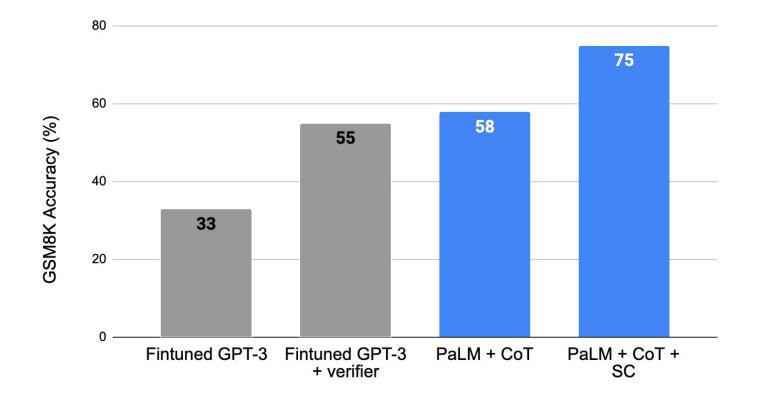

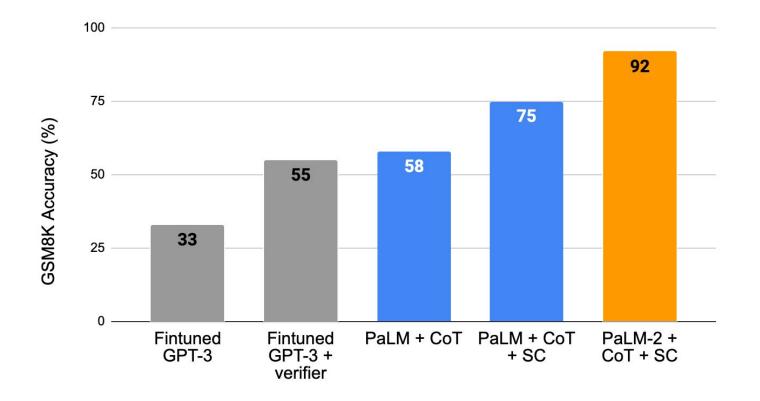

Figure 1: The self-consistency method contains three steps: (1) prompt a language model using example chains of thought; (2) sample from the language model's decoder to generate a diverse set of reasoning paths; and (3) choose the most consistent answer using the majority/plurality vote.

# Crushed GSM8K SOTA with only 8 examples

# Crushed GSM8K SOTA with only 8 examples

How many more examples are needed for finetuning to be comparable to CoT + SC?

"We perform finetuning... GSM8K ... it appears likely that the 175B model would require **at least two additional orders of magnitude** of training data to reach an **80% solve rate**."

Cobbe et al. Training Verifiers to Solve Math Word Problems. arXiv:2110.14168 [cs.LG], 2021.

# Solve high school math problems

- Finetuning PaLM with math data
- SC + CoT solves 50%!
- Non-math graduate students solve: 40%

Lewkowycz et al., 2022. Solving Quantitative Reasoning Problems With Language Models. **Question:** A particle moves so that it is at  $(3 \sin \frac{t}{4}, 3 \cos \frac{t}{4})$  at time t. Find the speed of the particle, measured in unit of distance per unit of time.

**Target:** The parametric curve  $(x, y) = (3 \sin \frac{t}{4}, 3 \cos \frac{t}{4})$  describes a circle with radius 3. Furthermore, it

makes a full revolution at time  $t = 8\pi$ . (figure) Therefore, the speed of the particle is  $\frac{6\pi}{8\pi} = \begin{vmatrix} \frac{3}{4} \end{vmatrix}$ 

**Model output:** The speed is the magnitude of the velocity vector. Therefore, we must first find the velocity vector, which is the derivative of the position vector. We have

$$\mathbf{v} = \frac{d}{dt} \left( 3\sin\frac{t}{4}, 3\cos\frac{t}{4} \right) = 3 \left( \cos\frac{t}{4}, -\sin\frac{t}{4} \right) \frac{1}{4} = \left( \frac{3}{4}\cos\frac{t}{4}, -\frac{3}{4}\sin\frac{t}{4} \right).$$

Therefore, the magnitude of the velocity vector is

$$\begin{split} |\mathbf{v}| &= \sqrt{\left(\frac{3}{4}\cos\frac{t}{4}\right)^2 + \left(-\frac{3}{4}\sin\frac{t}{4}\right)^2} = \sqrt{\frac{9}{16}\cos^2\frac{t}{4} + \frac{9}{16}\sin^2\frac{t}{4}} \\ &= \frac{3}{4}\sqrt{\cos^2\frac{t}{4} + \sin^2\frac{t}{4}} = \frac{3}{4}. \end{split}$$
 Therefore, the speed of the particle is  $\boxed{\frac{3}{4}}.$

"Self-consistency + chain-of-thought" crushed SOTA by large margin

# Why does self-consistency work? Marginalization!

 $rg \max \mathbb{P}(answer|problem)$ 

 $= \sum_{\text{rationale}} \mathbb{P}(\text{answer, rationale}|\text{problem})$ 

 $\approx \frac{\text{frequency of the answer}}{\text{total number of sampled responses}} \\ \propto \text{ frequency of the answer}$ 

(find the answer with the maximum probability) (sum over all latent reasoning paths)

(approximate the sum by sampling)

(ignore the common factor of the same size )

Thus,  $\arg \max \mathbb{P}(\operatorname{answer}|\operatorname{problem}) \approx \operatorname{selecting the most frequent answer}$ .

Self-consistency is the empirical implementation of marginalization. Don't be superficial to interpret it as majority voting!

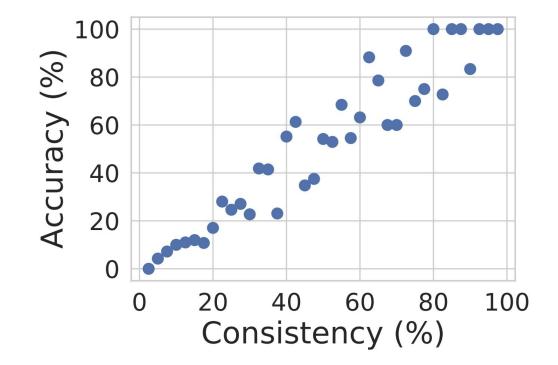

# Self-consistency $\arg \max \mathbb{P}(\operatorname{answer}|\operatorname{problem})$ Chain-of-thought $\arg \max \mathbb{P}(\operatorname{answer}, \operatorname{rationale}|\operatorname{problem})$

When there is no reasoning path, we don't need self-consistency, since we can then directly choose the most likely answer based on the given probabilities!

### More consistent, more likely to be correct!

# Least-to-Most Prompting

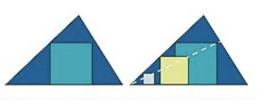

#### Enable easy-to-hard generalization by decomposition

Denny Zhou, Nathanael Schärli, Le Hou, Jason Wei, Nathan Scales, Xuezhi Wang, Dale Schuurmans, Claire Cui, Olivier Bousquet, Quoc Le, Ed Chi. <u>Least-to-Most Prompting Enables Complex Reasoning in Large Language Models</u>. **ICLR 2023**.

# Key Idas of Least-to-Most Prompting

- 1. **Decompose** a complex problem into a list of easier subproblems
- 2. Sequentially solve these subproblems (from least to most complex)

Least-to-Most Prompting = Planning + Reasoning

**Decomposing and recombining** are important operations of the mind.

differently. You decompose the whole into its parts, and you recombine the parts into a more or less different whole.

1. If you go into detail you may lose yourself in details. Too many or too minute particulars are a burden on the mind. They may prevent you from giving sufficient attention to the main point, or even from seeing the main point at all. Think of the man who cannot see the forest for the trees.

a new aspect of mathematical method

With a new foreword by John H. Conway

G. POLYA

### Solve math problems by decomposition

**Q:** Elsa has 3 apples. Anna has 2 more apples than Elsa. How many apples do they have together?

A: Let's break down this problem: 1. How many apples does Anna have? 2. How many apples do Elsa and Anna have together?

1. Anna has 2 more apples than Elsa. So Anna has 2 + 3 = 5 apples.

2. Anna has 5 apples. Elsa and Anna have 3 + 5 = 8 apples together. The answer is 8.

**Q:** Eliza's rate per hour for the first 40 hours she works each week is \$10. She also receives an overtime pay of 1.2 times her regular hourly rate. If Eliza worked for 45 hours this week, how much are her earnings for this week?

**A**:

### Solve math problems by decomposition (Cont')

•••

**Q:** Eliza's rate per hour for the first 40 hours she works each week is \$10. She also receives an overtime pay of 1.2 times her regular hourly rate. If Eliza worked for 45 hours this week, how much are her earnings for this week?

A: Let's break down this problem: 1. How much does Eliza earn for the first 40 hours she works each week? 2. How much does Eliza earn in overtime pay? 3. How much does Eliza earn in total for the week?

1. Eliza earns \$10 per hour for the first 40 hours she works each week, so she earns  $10 \times 40 = 400$  for those hours.

2. Eliza earns 1.2 times her regular hourly rate for overtime hours, so she earns 1.2 x \$10 = \$12 per overtime hour. Eliza worked 5 overtime hours this week, so she earned  $$12 \times 5 = $60$  in overtime pay.

3. Eliza's total earnings for the week are 400 + 60 = 460.

The answer is: \$460

### Commonsense reasoning by decomposition (StrategyQA)

**Q**: Can sunlight travel to the deepest part of the Black Sea?

A: Let's breakdown this problem: "What is the maximum depth of the Black Sea?", "How deep can sunlight penetrate a sea?", "Can sunlight travel to the deepest part of the Black Sea?"

- 1. The Black Sea has a maximum depth of 2,212 meters.
- 2. Sunlight does not penetrate water below 1000 meters.

3. 1000 meters is less than 2,212 meters. So sunlight cannot travel to the deepest part of the Black Sea Then answer is: false.

#### **Q: Did Aristotle use a laptop?**

### Commonsense reasoning by decomposition (Cont')

A: Let's breakdown this problem: "When was the laptop invented?", "When did Aristotle live?", "Did Aristotle Use a Laptop?"

1. The laptop was invented in 1981.

...

2. Aristotle lived from 384 BC to 322 BC.

3. 1981 is greater than 322 BC. So Aristotle did not use a laptop. The answer is: false.

#### Last-letter task (length generalization)

Method	L = 4	L = 6	L = 8	L = 10	L = 12
Standard prompting	0.0	0.0	0.0	0.0	0.0
Chain-of-Thought	89.4	75.0	51.8	39.8	33.6
Least-to-Most	94.0	88.4	83.0	76.4	74.0

Table 3: Accuracies of different prompting methods with code-davinci-002 on the last-letterconcatenation task with the length of lists increasing from 4 to 12. All the methods are 2-shot. Q: "think, machine, learning" A: "think", "think, machine", "think, machine, learning"

#### Decomposition

Table 1: Least-to-most prompt context (decomposition) for the last-letter-concatenation task. It can decompose arbitrary long lists into sequential sublists with an accuracy of 100%.

Q: "think, machine" A: The last letter of "think" is "k". The last letter of "machine" is "e". Concatenating "k", "e" leads to "ke". So, "think, machine" outputs "ke".

Q: "think, machine, learning" A: "think, machine" outputs "ke". The last letter of "learning" is "g". Concatenating "ke", "g" leads to "keg". So, "think, machine, learning" outputs "keg".

Table 2: Least-to-most prompt context (solution) for the last-letter-concatenation task. The two exemplars in this prompt actually demonstrate a base case and a recursive step.

#### <u>SCAN</u> (compositional generalization): text-to-actions

Method	Standard prompting	Chain-of-Thought	Least-to-Most
code-davinci-002	16.7	16.2	99.7
text-davinci-002	6.0	0.0	76.0
code-davinci-001	0.4	0.0	60.7

Table 8: Accuracies (%) of different prompting methods on the test set of SCAN under length split. The results of text-davinci-002 are based on a random subset of 100 commands.

#### <u>CFQ</u> (compositional generalization): text-to-code

	MCD1	MCD2	MCD3	Ave.	
Fully Supervised					
T5-base (Herzig et al., 2021)	58.5	27.0	18.4	34.6

### Anything better than "Let's think step by step"?

# Let LLMs optimize it!

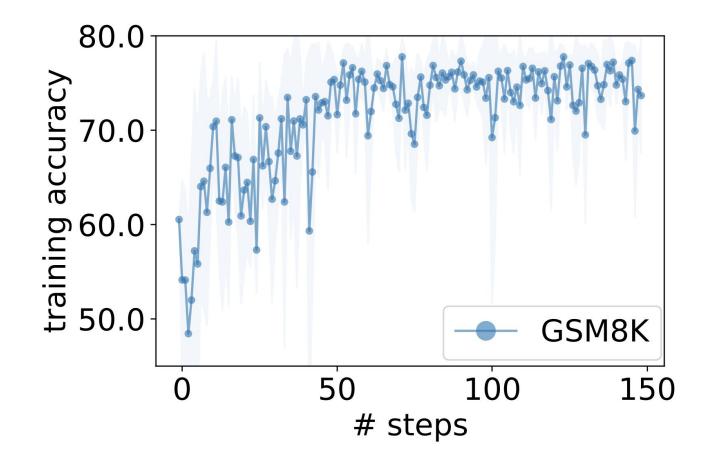

Text: Let's figure it out! Score: 61

**Text:** Let's solve the problem. **Score:** 63

(... more texts and scores ...)

Write your new text that is different from the old ones and has a score as high as possible.

# Results on GSM8K w/ PaLM

"Let's think step by step" 71.8%

"Take a deep breath and work on this problem step-by-step" 80.2% (found by LLM optimization)

# Why LLMs can reason?

## Reasoning as an emergent behavior

- Reasoning emerges from next-token-prediction pretraining
  - CoT is discovered, not manually designed
  - Sharp reasoning performance transition vs (#parameters, #tokens)
- Distill big models to small ones? Check performance on reasoning tasks!

# "How to make parrots intelligent?"

"Scaling up!"

https://twitter.com/denny\_zhou/status/1591451847239 32544?s=20

## Toward understanding in-context learning

- Transformer models are meta-learners: implicitly learned training algorithms (like gradient descent) from pretraing
- In the inference time, transformer models implicitly built the prediction model from the inputs and then predict

Ekin Akyürek, Dale Schuurmans, Jacob Andreas, Tengyu Ma, and Denny Zhou. <u>What learning algorithm is in-context</u> <u>learning? Investigations with linear models.</u> **ICLR 2023**.

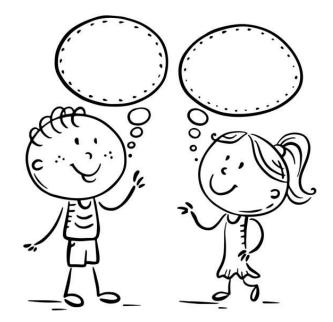

# Summary

- Chain-of-thought: add "thought" before final "answer"
- Self-consistency: sample repeatedly, and select the most frequent answer
- Least-to-most: decompose to subproblems and solve them one by one
- Instruction finetuning: enable zero-shot / chat
